Revision Test Papers (RTPs)

May 2018 to Sep 2024

7. SM Motors Ltd. is a manufacturer of auto components. Following are the details of expenses for the year 2022-23:

	(₹)
(i) Opening Stock of Material	15,00,000
(ii) Closing Stock of Material	20,00,000
(iii) Purchase of Material	1,80,50,000
(iv) Direct Labour	90,50,000
(v) Factory Overhead	30,80,000
(vi) Administrative Overhead	20,50,400

During the FY 2023-24, the company has received an order from a car manufacturer where it estimates that the cost of material and labour will be ₹ 80,00,000 and ₹ 40,50,000 respectively. The company charges factory overhead as a percentage of direct labour and administrative overheads as a percentage of factory cost based on previous year's cost. Cost of delivery of the components at customer's premises is estimated at ₹ 4,50,000.

You are required to:

- Calculate the overhead recovery rates based on actual costs for 2022-23.
- Prepare a Job cost sheet for the order received and the price to be quoted if the desired profit is 25% on sales.

RTP Nov 2023 – Q7

7. (i) Calculation of Overhead Recovery Rate:

$$\text{Factory Overhead Recovery Rate} = \frac{\text{₹ } 30,80,000}{\text{₹ } 90,50,000} \times 100 = 34\% \text{ of Direct labour}$$

$$\text{Administrative Overhead Recovery Rate} = \frac{\text{₹ } 20,50,400}{\text{₹ } 2,96,80,000} \times 100 = 6.91\% \text{ of Factory Cost}$$

Working Note: Calculation of Factory Cost in 2022-23

Particulars	Amount (₹)
Opening Stock of Material	15,00,000
Add: Purchase of Material	1,80,50,000
Less: Closing Stock of Material	(20,00,000)
Material Consumed	1,75,50,000
Direct Labour	90,50,000
Prime Cost	2,66,00,000
Factory Overhead	30,80,000
Factory Cost	2,96,80,000

(ii) Job Cost Sheet for the order received in 2023-24

Particulars	Amount (₹)
Material	80,00,000
Labour	40,50,000
Factory Overhead (34% of ₹ 40,50,000)	13,77,000
Factory Cost	1,34,27,000
Administrative Overhead (6.91% of ₹1,34,27,000)	9,27,806
Cost of delivery	4,50,000
Total Cost	1,48,04,806
Add: Profit @ 25% of Sales or 33.33% of cost	49,34,935
Sales value (Price to be quoted for the order)	1,97,39,741

Hence the price to be quoted is ₹1,97,39,741.

RTP Nov 2018 – Q8

8. A company has been asked to quote for a job. The company aims to make a net profit of 30% on sales. The estimated cost for the job is as follows:

Direct materials 10 kg @ ₹10 per kg

Direct labour 20 hours @ ₹5 per hour

Variable production overheads are recovered at the rate of ₹ 2 per labour hour.

Fixed production overheads for the company are budgeted to be ₹1,00,000 each year and are recovered on the basis of labour hours.

There are 10,000 budgeted labour hours each year. Other costs in relation to selling, distribution and administration are recovered at the rate of ₹50 per job.

DETERMINE quote for the job by the Company.

8. Determination of quotation price for the job

Cost	(₹)
Direct Material (10kg × ₹10)	100
Direct Labour (20hrs × ₹5)	100
Variable production overhead (20hrs × ₹2)	40
Fixed Overhead $\left(\frac{₹1,00,000}{10,000 \text{ budgeted hours}} \times 20 \text{ hours} \right)$	200
Other costs	50
Total costs	490

Net profit is 30% of sales, therefore total costs represent 70% $(₹ 490 \times 100) \div 70 = ₹ 700$
price to quote for job.

To check answer is correct; profit achieved will be ₹ 210 $(₹ 700 - ₹ 490)$

$= ₹ 210 \div ₹ 700 = 30\%$

PYQ May 2023 – Q1a

- (a) TSK Limited manufactures a variety of products. The annual demand for one of its products- Product 'X' is estimated as ₹1,35,000 units. Product 'X' is to be manufactured done in batches. Set up cost of each batch is ₹3,375 and inventory holding cost is ₹5 per unit. It is expected that demand of Product 'X' would be uniform throughout the year.

Required:

- (i) Calculate the Economic Batch (EBQ) for Product 'X'.
- (ii) Assuming that the company has a policy of manufacturing 7,500 units of Product 'X' per batch, calculate the additional cost incurred as compared to the cost incurred as per Economic Batch Quantity (EBQ) as computed in (i) above. **(5 Marks)**

PYQ May 2023 – Q1a

(a) (i) Economic Batch Quantity (EBQ) = $\sqrt{\frac{2DS}{C}}$

where,

D = Annual demand for the product

S = Set-up cost per batch

C = Carrying cost per unit per annum.

$$\sqrt{\frac{2DS}{C}} = \sqrt{\frac{2 \times 1,35,000 \times 3,375}{5}} = 13,500 \text{ units.}$$

PYQ May 2023 – Q1a

- (ii) Total Cost (of maintaining the inventories) when batch size (Q) are 13,500 and 7,500 units respectively

Total cost = Total set-up cost + Total carrying cost.

	When batch size is 13,500 units	When batch size is 7,500 units
Total set up cost	$= \frac{1,35,000}{13,500} \times ₹ 3,375 = ₹ 33,750$ Or, No. of setups = 10 $= 10 \times ₹ 3,375 = ₹ 33,750$	$= \frac{1,35,000}{7,500} \times ₹ 3,375 = ₹ 60,750$
Total Carrying cost	$\frac{1}{2} \times 13,500 \times 5 = ₹ 33,750$	$\frac{1}{2} \times 7,500 \times 5 = ₹ 18,750$
Total Cost	₹ 67,500	₹ 79,500

₹ 12,000 is the excess cost borne by the company due to batch size not being economic batch quantity.

PYQ Jan 21 – Q1d

- (d) *GHI Ltd. manufactures 'Stent' that is used by hospitals in heart surgery. As per the estimates provided by Pharmaceutical Industry Bureau, there will be a demand of 40 Million 'Stents' in the coming year. GHI Ltd. is expected to have a market share of 2.5% of the total market demand of the Stents in the coming year. It is estimated that it costs ₹ 1.50 as inventory holding cost per stent per month and that the set-up cost per run of stent manufacture is ₹ 225.*

Required:

- (i) What would be the optimum run size for Stent manufacture?*
- (ii) What is the minimum inventory holding cost?*
- (iii) Assuming that the company has a policy of manufacturing 4,000 stents per run, how much extra costs the company would be incurring as compared to the optimum run suggested in (i) above?*

(4 x 5 = 20 Marks)

PYQ Jan 21 – Q1d

- (d) (i) **Computation of Optimum Run size of 'Stents' or Economic Batch Quantity (EBQ)**

$$\text{Economic Batch Quantity (EBQ)} = \sqrt{\frac{2DS}{C}}$$

Where, D = Annual demand for the Stents
= 4,00,00,000 × 2.5% = 10,00,000 units

S = Set- up cost per run
= ₹ 225

C = Carrying cost per unit per annum
= ₹ 1.50 × 12 = ₹ 18

$$\begin{aligned}\text{EBQ} &= \sqrt{\frac{2 \times 10,00,000 \times ₹ 225}{₹ 18}} \\ &= 5,000 \text{ units of Stents}\end{aligned}$$

PYQ Jan 21 – Q1d

(ii) Minimum inventory holding cost

Minimum Inventory Cost = Average Inventory × Inventory Carrying Cost per unit per annum

$$= (5,000 \div 2) \times ₹ 18$$

$$= ₹ 45,000$$

(iii) Calculation of the extra cost due to manufacturing policy

	When run size is 4,000 units	When run size is 5,000 units i.e. at EBQ
Total set up cost	$= \frac{10,00,000}{4,000} \times ₹ 225$ $= ₹ 56,250$	$\frac{10,00,000}{5,000} \times ₹ 225$ $= ₹ 45,000$
Total Carrying cost	$\frac{1}{2} \times 4,000 \times ₹ 18$ $= ₹ 36,000$	$\frac{1}{2} \times 5,000 \times ₹ 18$ $= ₹ 45,000$
Total Cost	₹ 92,250	₹ 90,000

$$\text{Extra cost} = ₹ 92,250 - ₹ 90,000 = ₹ 2,250$$

PYQ Nov 18 – Q3a

- (a) XYZ Ltd. has obtained an order to supply 48000 bearings per year from a concern. On a steady basis, it is estimated that it costs ₹ 0.20 as inventory holding cost per bearing per month and the set-up cost per run of bearing manufacture is ₹ 384.

You are required to:

- (i) compute the optimum run size and number of runs for bearing manufacture.
- (ii) compute the interval between two consecutive runs.
- (iii) find out the extra costs to be incurred, if company adopts a policy to manufacture 8000 bearings per run as compared to optimum run Size.
- (iv) give your opinion regarding run size of bearing manufacture.

Assume 365 days in a year.

(10 Marks)

PYQ Nov 18 – Q3a

- (a) (i) Optimum batch size or Economic Batch Quantity (EBQ):

$$EBQ = \sqrt{\frac{2DS}{C}} = \sqrt{\frac{2 \times 48,000 \times 384}{2.4}} = 3919.18 \text{ or } 3,920 \text{ units}$$

$$\text{Number of Optimum runs} = 48,000 \div 3,920 = 12.245 \text{ or } \mathbf{13 \text{ run}}$$

- (ii) Interval between 2 runs (in days) = $365 \text{ days} \div 13 = 28 \text{ days}$

$$\text{Or } 365 \div 12.24 = 29.82 \text{ days}$$

- (iii) If 8,000 bearings are manufactures in a run:

$$\begin{aligned} \text{Total cost} &= \text{Set-up cost} + \text{Inventory holding cost} \\ &= ₹.384 \times (48,000 \div 8,000) + (8,000 \div 2) \times ₹.2.4 \\ &= \mathbf{2304 + 9,600} = 11,904 \end{aligned}$$

$$\text{Extra cost} = ₹(11,904 - 9,406^*) = ₹ \mathbf{2,498/-}$$

OR

$$\text{Extra cost} = ₹ (11,904 - 9,696^*) = ₹ \mathbf{2,208/-}$$

* Minimum Inventory Cost = Average Inventory × Inventory Carrying Cost per unit per annum

PYQ Nov 18 – Q3a

Average Inventory = $3,920 \text{ units} \div 2 = 1,960 \text{ units}$

Carrying Cost per unit per annum = $\text{₹}0.2 \times 12 \text{ months} = \text{₹}2.4$

Minimum Inventory Holding Costs = $1,960 \text{ units} \times \text{₹}2.4 = \text{₹}4,704$

Total cost = Set-up cost + Inventory holding cost = $(12.245 \times 384) + 4704 = \text{₹ } 9,406$
(approx.)

OR

Total cost = Set-up cost + Inventory holding cost = $(13 \times 384) + 4704 = \text{₹ } 9,696$
(approx.)

- (iv) To save cost the company should run at optimum batch size i.e. 3,920 Units. **It saves ₹ 2,498 or 2208.** Run size should match with the Economic production run of bearing manufacture. When managers of a manufacturing operation make decisions about the number of units to produce for each production run, they must consider the costs related to setting up the production process and the costs of holding inventory
